

- When work is (+), PE is (-)

ie: moving to an area of lower PE

- When work is (-), PE is (+)

ie: moving to area of high PE

$$W = qEd \cos \theta$$

Ex 1:

a) What is the work done the particle?

$$\begin{aligned}
 W &= q E d \cos \theta \\
 &= (5 \times 10^{-6})(10000)(8) \cos 30 \\
 &= 0.35 \text{ J}
 \end{aligned}$$

b) What is the change in PE of the particle?

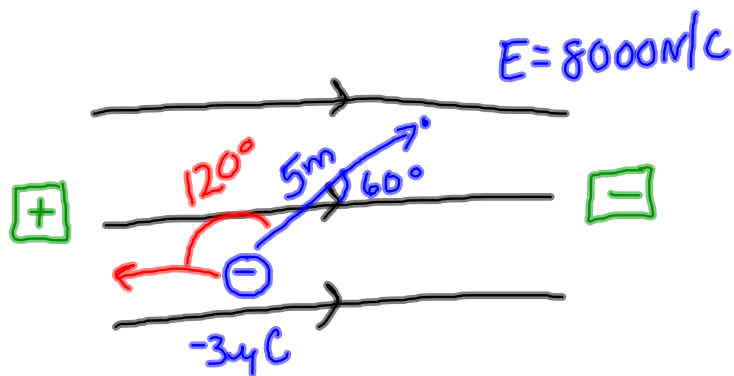

$$\begin{aligned}
 -W &= \Delta PE \\
 -0.35 &= \Delta PE
 \end{aligned}$$

Ex 2:

A uniform field of magnitude 5000 N/C points due East. A 5 μC charge is moved 5m due East. Find the work done on the charge and the change in the potential energy.

$$\begin{aligned}W &= q E d \cos \theta \\ &= (5 \times 10^{-6})(5000)(5) \cos 0 \\ &= 0.125 \text{ J}\end{aligned}$$

$$\Delta PE = -0.125 \text{ J}$$

Ex 3:

$$W = ?$$

$$= q E d \cos \theta$$

$$= (3 \times 10^{-6})(8000)(5) \cos 120$$

$$W = -0.06 \text{ J}$$

$$\Delta \text{PE} = ?$$

$$\Delta \text{PE} = +0.06 \text{ J}$$

⊙ determiniz the sign of W

$$0 \leq \theta \leq 90 = \begin{array}{l} (+) W \\ (-) PE \end{array}$$

$$90 < \theta \leq 180 = \begin{array}{l} (-) W \\ (+) PE \end{array}$$

When a (+) or (-) charge is released
(free to move) in an electric field, it will
move in such a way that the Work done
will be (+) and the change in electric
potential energy will be NEGATIVE.

Electric Potential: The work done to move a positive charge from infinity to that point.

Assume $V_{@∞} = 0$

$$\begin{aligned} V &= -Ed \\ &= -5000(5) \\ &= -25000 \text{ V} \end{aligned}$$

Ex 4:

1) Find W

$$W = (3 \times 10^{-6})(8000)(5)$$

$$= 0.12 \text{ J}$$

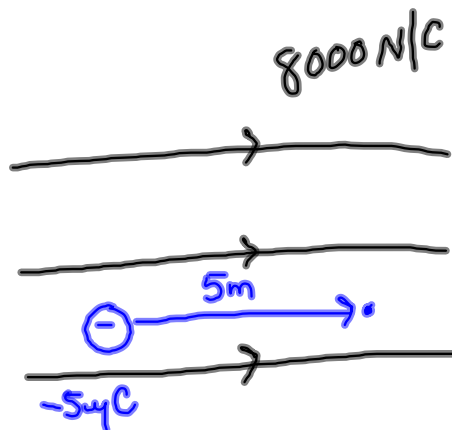

2) Find ΔPE

$$= -0.12 \text{ J}$$

3) Find ΔV

$$= \frac{-0.12 \text{ J}}{3 \times 10^{-6}} = -40,000 \text{ V}$$

$$= -(8000)(5)$$

Ex 5:

1) $W =$

$(5 \times 10^{-6})(8000)(5) \cos 180$

$W = -0.2 \text{ J}$

2) $\Delta \text{PE} = 0.2 \text{ J}$

3) $\Delta V = -Ed$

$= -8000(5) = -40,000 \text{ V}$

$= \frac{\Delta \text{PE}}{q} = \frac{0.2}{-5 \times 10^{-6}} = -40,000 \text{ V}$

Keep sign
of q

- As you move from one point to another in the SAME direction as the field, the Electric potential decreases
- If you move opposite direction to the E. field, electric potential increases.

Ex 6:

$$\begin{array}{cc} \text{A} & \text{B} \\ \bullet & \bullet \\ V_A = 100\text{V} & V_B = 300\text{V} \end{array}$$

A positive $5\mu\text{C}$ charge is moved from A to B.

Find the change in potential energy ΔPE of the charge.

$$\begin{aligned} \Delta V &= V_B - V_A \\ &= 300\text{V} - 100\text{V} \\ &= 200\text{V} \end{aligned}$$

$$\Delta V = \frac{\Delta\text{PE}}{q}$$

$$200\text{V} = \frac{\Delta\text{PE}}{5\text{E-}6}$$

$$\Delta\text{PE} = 0.001\text{ J}$$
